

## **Safety Gloves**

### **POST Safety Gloves Chart**

Safety gloves are standard PPE and protect hands from abrasions, cuts, tears and punctures. POST has developed a chart to help determine the proper glove for the task.

[Download the POST Glove Chart](#)

## GLOVE REFERENCE GUIDE

### Cotton and Disposable

Cotton gloves provide very minimal protection to hands. Disposable Nitrile gloves provide prevention of hydro-carbon and liquid absorption into skin

### Nitrile Dipped Gloves

Provide excellent protection when dealing with oils, lubricants, and petroleum liquids. Can be found with a cut resistant rating.

### Leather Gloves

Provide protection to hands from the elements as well as scrapes but seldom provide any cut resistant protection. Best used when handling such materials as wood and bricks.

### Cut Resistant Dexterity Gloves

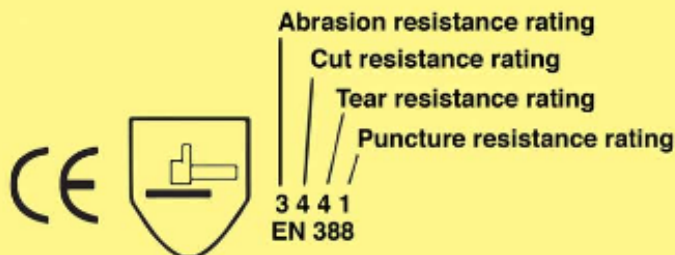

Available in ratings from 1-5. Should be worn any time you are handling tools or materials that could easily cut or scrape your skin. (i.e.) Using self retracting blades, handling duct work, using a saw, handling glass or working with light fixtures. (Best practice would be to wear this type always to avoid injury to hands).

EN symbol used to describe performance of gloves rated for mechanical hazard protection

Remember:

- Use the right glove for the task
- If the tool or material you are handling could cut you, wear cut resistant gloves

**STOP & THINK BEFORE EVERY TASK**

## **Glove Resources:**

### **Cut Protection vs. Cut Resistance**

**Cut Protection** is the combination of influences that tend to prevent a worker from being cut.

**Cut Resistance** is the ability of the material to resist damage when challenged with a moving sharp edged object.
